

MEETING MINUTES

CC in the Cloud Quarterly Meeting

Date: August 26, 2026

Chair: Joshua Brickman

Primary technical update: Brandon — DBMS cloud and database-as-a-service implementation

Summary

The Technical Community reviewed a practical implementation of the CC in the Cloud guidance for the Database Management Systems (DBMS) protection-profile family. Brandon demonstrated a visual Reader's Guide and Requirements Explorer that connect the Base cPP, Cryptographic Functions Module, Cloud Module, and Database-as-a-Service (DBaaS) Module. The group viewed this work as a useful reference implementation for other ITCs considering cloud and service-based evaluation models.

The Cloud and Crypto modules were described as relatively mature, while the DBaaS work is approximately 75% complete. Formal voting and public-comment activity are expected after ICCC, with DBaaS following later. The group also discussed CCUF communications, ICCC participation, member transitions, and recurring-meeting logistics.

Discussion

1. Meeting administration and CCUF updates

- Participants experienced inconsistent calendar invitations, including different dates, missing entries, and an invalid meeting ID. The prior minutes' September 9 date was acknowledged as an error.
- The group will continue on an approximately quarterly cadence. The next meeting should be scheduled roughly three months from this meeting and should avoid Thanksgiving week.
- CCUF announcements can be shared through the CCUF LinkedIn page as well as the CCUF portal.
- No formal CC in the Cloud session is planned during the CCUF Workshop, but an informal lunch or coffee gathering at ICCC may be organized based on attendance.

2. Membership and related project updates

- Jade announced that she will leave government at the end of October and will no longer chair the SBOM iTC. She noted continuing work on SBOM guidance and on interim MDM evaluation comments, including cloud-related technical queries being discussed through the GPOS mobility group and tracked on GitHub.
- The group welcomed Jared Fleming, who is joining the team (affiliation and email to be provided)

3. DBMS cloud and DBaaS reference implementation

- The DBMS work applies the CC in the Cloud guidance through a Base cPP plus modular configurations for cryptographic functions, tenant-operated cloud deployments, and provider-operated DBaaS deployments.

- The Cloud configuration addresses databases that are lifted and shifted into a cloud operating environment or designed to be cloud native. The DBaaS configuration adds service-plane, provider-role, and tenant-isolation considerations.
- The Reader's Guide, Requirements Explorer, architecture views, SFR links, and trigger map make dependencies and ownership across the documents easier to review. The group responded especially positively to the visual mapping and suggested that the approach could improve PP review more generally.
- The implementation includes customer-controlled encryption keys and a trusted-channel relationship between the database and the key-management entity.
- Discussion emphasized defining workable TOE and trusted-platform boundaries so testing remains manageable while still providing meaningful assurance. The approach includes boundary conditions and rationale for avoiding one-to-one testing of every API endpoint when equivalent security functions provide reasonable assurance.
- The group discussed NIAP's earlier CC in the Cloud evaluation of Microsoft Intune, completed before publication of the guidance. That evaluation provided a useful precedent, while its scope did not extend to every security function or to tenant-data isolation within the service control plane—areas the DBMS work is addressing more explicitly for managed-service assurance.
- The DBaaS pattern may be adaptable to other service models, including SaaS, PaaS, virtual network devices, and cloud-native web application firewalls.

4. Publication, adoption, and ICCC

- The DBMS-iTC materials are publicly available in PDF, HTML, and source formats, together with review packages, supporting documentation, an interactive review supplement, and GitHub issue templates.
- The Cloud and Crypto modules are expected to proceed toward a formal vote after ICCC and then a public-comment period. The DBaaS module is expected to follow after further development.
- Brandon plans to use the reference implementation and lessons learned in his ICCC presentation and to consider an appendix to the CC in the Cloud guidance describing implementation choices and pain points.
- The group discussed using the DBMS work as a roadmap for extending Common Criteria assurance to services and for addressing assurance questions that are not covered at the same technical depth by broader cloud authorization frameworks.
- Joshua noted planned ICT Compliance Pod interviews at ICCC and the possibility of live streaming, subject to reliable venue connectivity.

Decisions and direction

- Treat the DBMS work as a reference implementation and source of lessons learned for other iTCs, without making it a mandatory pattern.
- Continue publication planning for the mature Cloud and Crypto modules after ICCC; continue development of the DBaaS module for a later vote and public-comment cycle.
- Use the next quarterly meeting to review ICCC outcomes and discuss whether other iTCs are adopting or adapting the approach.

Action items

Owner	Action	Timing
Joshua	Edit and post the consolidated AI-generated minutes to the group repository.	Post-meeting
Joshua	Send a corrected or replacement calendar invitation for the next quarterly meeting, avoiding Thanksgiving week.	Post-meeting
Joshua	Survey ICCC attendance and, if there is sufficient interest, organize an informal in-person gathering.	Before ICCC
Brandon	Continue refining the DBMS Cloud/Crypto/DBaaS materials and prepare the ICCC presentation, including lessons learned that may inform a guidance appendix.	Before/after ICCC
Jade and her replacement	Continue coordination of the cloud-related interim MDM evaluation comments through the GPOS mobility discussion.	Current work cycle

Open items and risks

- Calendar interoperability and recurring-invite errors may continue to suppress attendance unless the invitation is replaced and verified.
- The DBaaS module remains incomplete and will require further development, formal voting, and public comment.
- The timing and outcome of formal votes—and the extent to which other iTCs will adopt the pattern—remain open.
- Any live streaming from ICCC depends on venue connectivity.
